The Modern Gladiolus

The development of this most popular summer flower has been so rapid during the past ten or fifteen years that practically all of the old varieties have been discarded and in their place we have a most astonishing collection of new seedlings and hybrids, brilliant in color, enormous in size as compared with the old garden sorts, and especially adapted to garden and house decorations on account of the lasting quality of the blooms.

Lovers of beautiful flowers will find that a collection of choice named varieties will give a great deal of pleasure for a small outlay, as the bulbs will retain their vitality five to eight years.

A **young bulb** of medium size is most valuable and old worn out bulbs of any size are practically worthless.

Any time from April 20th to June 15th, plant the bulbs right side up in single or double rows in deep furrows, leaving three inches space between the bulbs.

Do not plant in a shady location and do not allow fresh stable manure in contact with the bulbs. A sandy loam is ideal. Plant deep. Three to four inches of soil over the bulbs will keep them cool and moist and help to hold the stalks erect without the use of stakes.

If the spike is wanted for market or indoor use cut it off eight or ten inches from the ground, the morning after the first bud opens.

From the first to the middle of October in this locality is a good time to dig the bulbs, cutting off the old stalk and after drying out pull off the old corm with the roots and store in shallow boxes. If kept too warm or too damp they sprout in storage. 40° to 45° is best.
